

P 79

80. Troctolite, Volpersdorf, Silesia.

Macr. Hypidiomorphic even-grained rock, composed of *plagioclase*, grey, fairly large crystals with twin-striation; *diallage*, grains, with bronze-like schiller; *olivine*, black.

Micr. The components exhibit the same characteristics as in the olivine-gabbro of the same locality (no 76), though *diallage* is less, *olivine* more abundant, the latter serpentized in the usual manner, the black colour of olivine mentioned above is produced by separation of *magnetite*.

DIOPSIDE
